In support of SB 212

Chairman Hilderbrand and Senate Public Health and Welfare Committee Members –

In the Spring of 2017, my youngest son, Roy, a gifted musician (pianist, violinist, trombonist) who was attending the University of Kansas, called to report that he was having serious symptoms that sent him to the E.R. An MRI report, serious enough for us to travel to Lawrence, was the result. As my husband and I, along with Roy, stared at the MRI while the neurosurgeon pointed to lesion after lesion on Roy's brain, we were told that he would need to immediately begin treatment for M.S. and that he would have to be on medication for the rest of his life.

But the beginning of this journey goes back even further. In Roy's senior year of high school, TMP-M sent us a letter stating that he would need to receive a tetanus shot or he would not be given his diploma. Besides our moral objection to vaccinations due to the aborted fetal cell lines some still contain (There are still many that contain human DNA—there is even a set amount of DNA allowed in each vaccination.) and because our son Paul experienced seizures for several days after being vaccinated, we objected to him receiving it. Moreover, we knew that a tetanus shot was not necessary for Roy's health, but the school was adamant. In the end, Roy didn't want to make a fuss so close to graduation, so he decided to give in. The only tetanus shot that was available to him was the Dtap vaccination. So, instead of being injected with one virus, he was injected with diphtheria, pertussis, tetanus, as well as a host of other toxic ingredients, including formaldehyde and aluminum. High levels of aluminum have been found in children with autism, and formaldehyde is a known carcinogen.

Immediately, Roy developed daily, severe hives on his back. From that day forward, he was forced to take Claritin or other antihistamines to keep the hives under control—every day, without fail. On occasion, his face and head would swell up, become fire-engine red, and produce a scale-like, raised skin rash for no reason.

So...fast forward three years later and we are standing in the neurosurgeon's office counting lesions on Roy's 21-year-old brain. Since we knew that there had been something in the vaccines that caused a severe reaction in Roy—something that was triggering his immune system to overreact—which is what M.S. is—an autoimmune disease, I recalled what a pediatric neurosurgeon who gave a talk on vaccine injury said: "The vaccines are causing brain damage and symptoms that mimic other diseases like M.S." With this memory "nugget" in mind, we took Roy to a natural-path physician specializing in neurology who tested him for toxins—including aluminum and mercury, which can both be found in vaccinations--which has been largely hidden to the public. Roy tested to be toxic for both. This doctor immediately began a series of detox treatments for mercury and aluminum. After just 4 months, Roy's MRI was repeated. The entire left side of his brain was lesion free. After the remaining year's detoxing, a third MRI showed that his entire brain was lesion free—the only remaining tiny spots were deemed to be scar tissue. He hasn't had a single symptom since he was treated. Praise GOD!
